

The Genetics of SLE

By: John B. Harley MC, Ph.D. and Carisa M. Cooney

This article provides a brief background explaining how genetics, chromosomes and DNA work to predetermine bodily traits passed down from our parents. The article then goes into further detail on how genetics specifically relates to lupus, pointing out the complex balance between genes and the environment. These medical professionals point towards genetic “hot spots”, that many scientists believe may hold the secret to determining who gets lupus, why they get lupus and how lupus can be prevented.
